write a java program to convert infix expression to postfix expresssion. Implement the class stack with the methods push, pop and topofstack. Use the class stack in the conversion.

```
Code -
import java.util.Scanner;
class Stack {
  private char[] stack;
   private int top;
   private int size;
   public Stack(int size) {
      this.size = size;
       stack = new char[size];
       top = -1;
   public void push(char c) {
       if (top < size - 1) {
           stack[++top] = c;
   public char pop() {
       if (top >= 0) {
           return stack[top--];
       return '\0';
   public char peek() {
       if (top >= 0) {
           return stack[top];
       return '\0';
   public boolean isEmpty() {
       return top == -1;
public class yash {
   public static int precedence(char c) {
          return 1;
```

```
return 0;
public static String infixToPostfix(String infix) {
    Stack stack = new Stack(infix.length());
    StringBuilder postfix = new StringBuilder();
    for (int i = 0; i < infix.length(); i++) {</pre>
        char c = infix.charAt(i);
        if (Character.isLetterOrDigit(c)) {
            postfix.append(c);
        } else if (c == '(') {
            stack.push(c);
        } else if (c == ')') {
            while (!stack.isEmpty() && stack.peek() != '(') {
                postfix.append(stack.pop());
            stack.pop();
            while (!stack.isEmpty() && precedence(c) <= precedence(stack.peek())) {</pre>
                postfix.append(stack.pop());
            stack.push(c);
    while (!stack.isEmpty()) {
        postfix.append(stack.pop());
    return postfix.toString();
public static void main(String[] args) {
    Scanner sc = new Scanner(System.in);
    System.out.println("Enter infix expression:");
    String infix = sc.nextLine();
    String postfix = infixToPostfix(infix);
    System.out.println("Postfix expression: " + postfix);
```

Output -

```
Listening on 52315
User program running
Enter infix expression:
A+B*(C-D)

User program finished
Postfix expression: ABCD-*+
```
